

RT 100 R

**Specialist for the machining
of cast materials with patented
radius point geometry**

EXCLUSIVE**LINE**[®]

Ratio drill type RT 100 R

New materials require new tooling solutions. As an innovative tool manufacturer, Guhring has always followed this concept and is reacting to the increasing application of CGI (cast iron with compacted graphite iron) and ADI (austempered ductile iron) in the automotive industry with the new Ratio drill type RT 100 R.

High tensile strength is exceptionally demanding

CGI and ADI offer high tensile strengths, i.e. making it possible to increase the output of an engine whilst keeping the wall thickness of the engine block the same or to reduce the weight through thinner

wall thicknesses whilst keeping the output of the engine the same. Subsequently, the automotive industry is demanding tools from tool manufacturers that can economically machine these new materials. Conventional drills have so far not achieved satisfactory results.

Guhring has therefore developed the new Ratio drill type RT 100 R. Thanks to its patented radius point geometry it offers highest performance and economic efficiency for the machining of the new materials. With its unique balance of face contour and flute profile it provides rigidity, dimensional accuracy and process reliability.

New:

Standard range 5 x D and 7 x D

Now the wear resistant solid carbide drill is available as a standard item in the ExclusiveLine range. The two standard drills are 5 x D and 7 x D with internal cooling and are suitable for a wide range of applications. However, they offer ex-stock availability and reasonable prices.

Furthermore the RT 100 R is available as a special tool with or without internal cooling to fit your specific application. Guhring can, for example, provide application orientated coatings or even modify the design of a step drill. For the special tool request form please see page 7.

Powerful in common cast materials

The new radius point geometry offers more than machining of CGI and ADI. It is also recommended for the machining of common cast materials such as grey cast iron, spheroidal graphite and malleable cast iron.

Our recommendation:

The RT 100 R drills are especially suited for machining under minimal quantity lubrication conditions. With MQL we recommend a tool design with conical shank end and the application of Guhring's MQL screw and components. Please contact our technical service department for more information.

Selected machining results with RT 100 R drills

Diameter	16	17
Coating	FIRE	Super A
Material	GGG50	GGG40
Drilling depth (mm)	20	50
Cooling	IK	IK
Lubricant	neat oil	soluble oil
v_c [m/min]	120	160
f [mm/rev.]	0,5	0,6
Tool life [m]	615	305

Ratio drill type RT 100 R

Convincing:

Minimal wear in benchmark test

The performance capacity of the new RT 100 R was very impressively proven in two benchmark tests carried out for the automotive industry. The drill was convincing thanks to having the lowest wear and the highest process reliability in comparison to the other tools tested.

In the first test, PTW Darmstadt determined the wear of the tool by measuring the width of wear at the cutting edge following 100 m tool life travel. With a width of wear of only 0.196 mm, RT 100 R showed the least sign of wear (diagram 2).

PTW compared drills of 5.0 mm diameter with a drilling depth of 20 mm in GGV450 as well as high pressure internal cooling of 65 bar in the test. The cutting rates were $v_c = 80$ m/min. and $f = 0.2$ mm/rev.

In addition, PTW also determined the development of the outer corner wear in order to receive a prediction regarding the expected final tool life figure. Even after 5000 holes the outer corner wear showed a consistent low wear of the tool, reason to believe that the end of tool life had

not been reached by far – a clear indication of the high economic efficiency and process reliability of RT 100 R (diagram 1).

Tool life testing:

In the second test, a step drill type RT 100 R, FIRE-coated in the diameters 14.5 or 20.0 mm respectively with 45° chamfer was examined in GGV40. The drilling depth was 70 mm, the cutting rates were $v_c = 70$ m/min and $f = 0.3$ mm/rev.. The tool had internal cooling with 50 bar.

A minimum tool life of at least 120 m was expected to be achieved in the test. The step drill type RT 100 R had definitely not reached the end of its tool life after 214 m and showed an even wear pattern (diagram 3). Furthermore, it was the only drill in the test that kept the coating at the leading land intact for its entire tool life. In a second test the RT 100 R fared even better!

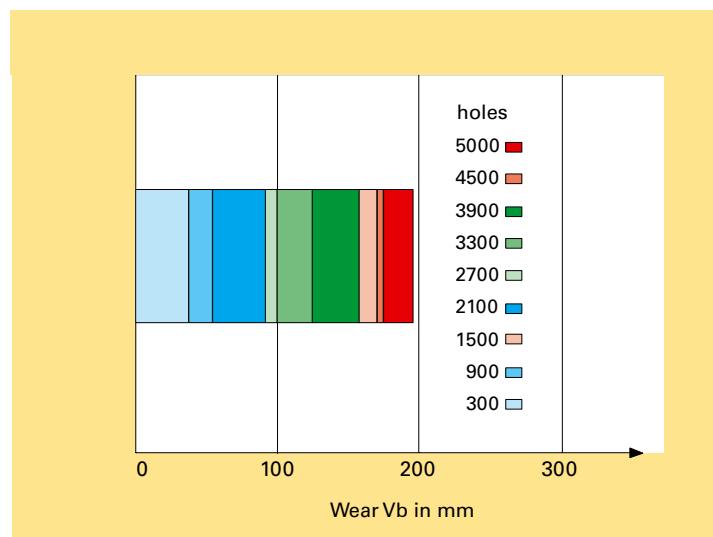

Diagram 1:
Development of the outer corner wear regarding to tool life

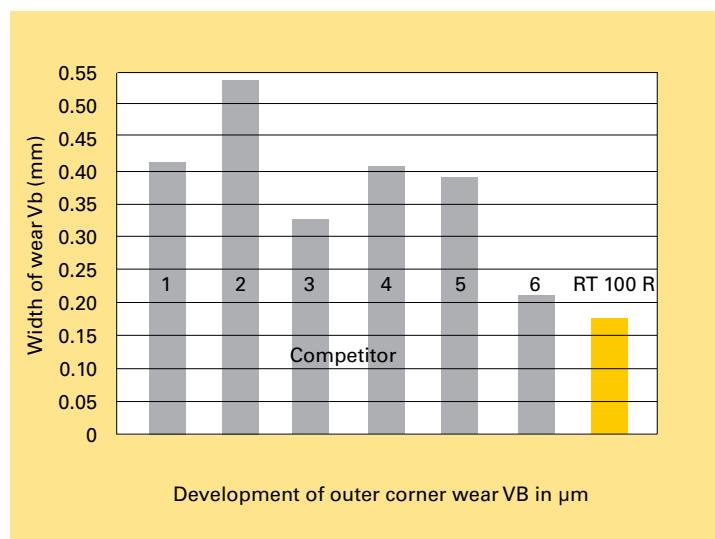

Diagram 2:
Width of wear after 100 m tool life: IXION BAZ 325
High pressure int. cooling 65 bar $v_c = 80$ m/min; $f = 0.2$ mm/rev.
 $d = 5.0$ mm; $t = 20$ mm Test at PTW

RT 100 R-Application recommendations

General hints:

Powerful machines, no play in spindle bearings, alignment accurate tool holders. Max. concentricity error of clamped tools 0.02 mm, high coolant pressures. We recommend the application of hydraulic chucks or shrink fit chucks.

Coolant hints:

We recommend lubrication by soluble oil or neat oil. Under special conditions cooling just by air is possible. But instead of air cooling we would always prefer minimal quantity lubrication, that the tools are especially suited for. With MQL we recommend the conical shank end and the Guhring MQL components. Please contact our technical service department for more information.
